Analysis of Colorants by HPLC-PDA

GL Sciences Inc.

Artificial colorants are widely used because of their low prices and useful chemical properties. For example, as compared with natural food dyes, many artificial colorants are more stable to heat, light, and oxygen. This feature is advantageous in quality control of the colorants. However, it has been pointed out that their excess or combinational use may cause toxic effect. In this note, a simultaneous determination method for 18 artificial colorants using PDA (photo-diode array) detector is described.

Column : Inertsil ODS-3 (5 μm, 150 x 4.6 mm I.D

Cat.No. 5020-01731

Eluent : A) CH₃CN, B) 10 mM Na₂HPO₄ (pH 6.9)

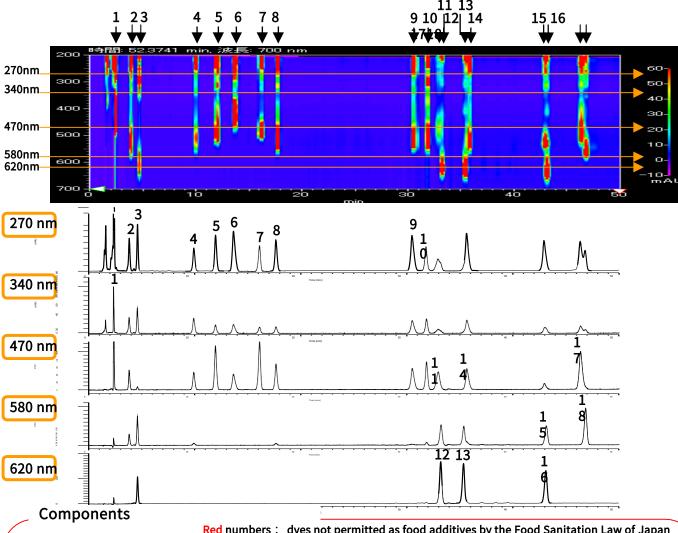

A/B = 10/90 - 50 min - 35/65

: 1.0 mL/min Flow rate :40°C Col. Temp.

: PDA Detector : 10 µL Injection Vol.

PDA detector is highly recommended for simultaneous determination of various compounds. Even if multiple peaks are detected at same retention time by monitoring with a certain wavelength, it may be possible to detect each compound as a single peak by detecting at other wavelengths.

The chromatogram shown below is an example. Peak 17 and peak 18 were not separated at wavelength of 270 nm. However, with shifting the wavelength to 470 nm peak 17 was obtained as single peak, and peak 18 also can be determined by detection at 580 nm.

Red numbers: dyes not permitted as food additives by the Food Sanitation Law of Japan
